August 03, 2026 Full Audit

Table of Contents

1. Executive Summary

Key Metrics, Critical Issues & Quick Wins

2. Audit Categories

What Works

Findings by Severity

3. Action Plan

Phased Roadmap

4. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **yt-seo-architect.vercel.app** for a **SaaS — free AI YouTube SEO tool (SoftwareApplication) with programmatic SEO glossary (EN/ES/PT), blog, and interactive tools** site, generated on August 03, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

58/100

SEO HEALTH SCORE

Critical Issues Found:

1. **Info:** Sitemap is ~29% broken: 23/80 sampled /glossary/ URLs return HTTP 404 (~3,000+ of 10,986 listed), incl. the 255-URL 'channel-optimization-for-small-channels' family
2. **Info:** Blog JSON-LD still unparseable on ~50% of sampled posts (unescaped HTML inside JSON strings) — Article+FAQPage rich results are broken on the newest content
3. **Info:** 24 identical /blog/* vs /tools/* slug pairs competing for the same keywords (cannibalization), both indexable
4. **Info:** E-E-A-T vacuum persists: /about noindex, anonymous authorship, Gmail contact, empty 'Trusted by' section, AI-template blog titles ('Learn how to X 2026')
5. **Info:** 5 noindex core URLs (/dashboard, /about, /changelog, /privacy-policy, /terms-of-service) still listed in sitemap; only 49/11,096 URLs have <lastmod>

Quick Wins:

1. Remove 404 glossary URLs + noindex core URLs from sitemap.xml and regenerate (single deploy, removes ~29% of broken sitemap)
2. Fix blog JSON-LD escaping in the post template (json_encode the strings) — restores rich results on all posts
3. Pick one home per cannibalized slug: 301 /tools/* article shells to /blog/* (24 pairs)
4. Add lastmod to glossary URLs in the sitemap generator (11,047 URLs missing it)
5. Add pagead2.googlesyndication.com + cdn.jsdelivr.net to CSP script-src so AdSense and analytics load

2. Audit Categories

2.1 Technical SEO

Score: 55/100

What Works

- HTTPS + HSTS (preload) on all routes; Vercel CDN with proper cache headers (immutable assets, max-age=0 for HTML)
- robots.txt clean: blocks only internal paths, allows all major AI crawlers (ChatGPT-User, Google-Extended, PerplexityBot, ClaudeBot, OAI-SearchBot)
- Core pages return 200; canonical tags present; the prior 6,400 glossary 500-errors are FIXED (vs-pages now render 200)
- llms.txt (200) and llms-full.txt (33KB, 200) now live
- hreflang en/es/pt/x-default correctly implemented on multilingual glossary pages

Findings

Sitemap contains ~29% broken (404) URLs **Critical**

11,096 URLs in sitemap.xml; 10,986 are /glossary/. Sampling 80 random glossary URLs: 23 return HTTP 404 (28.75%). The 'channel-optimization-for-small-channels' family alone accounts for 255 dead URLs (all 404). Extrapolated: ~3,000+ broken URLs are submitted to Google.

Recommendation: Audit and either generate the missing glossary combos or 301/410 them; regenerate sitemap from live-verified URLs only. Add an automated broken-link check to CI.

5 noindex core pages listed in sitemap **High**

/dashboard, /about, /changelog, /privacy-policy, /terms-of-service all return robots noindex/nofollow yet appear in sitemap.xml.

Recommendation: Exclude noindex URLs from the sitemap generator (or make /about indexable, see E-E-A-T).

Missing <lastmod> on 99.5% of URLs **Medium**

Only 49 of 11,096 URLs carry <lastmod>. Google cannot detect freshness for the glossary.

Recommendation: Emit lastmod (and ideally changefreq) for glossary entries in the sitemap generator.

Security header gaps + missing security.txt **Medium**

X-Frame-Options, X-Content-Type-Options (nosniff), and Referrer-Policy are absent from responses. /.well-known/security.txt and /security.txt return 404.

Recommendation: Add XFO (SAMEORIGIN), nosniff, Referrer-Policy to vercel.json headers; publish a security.txt.

Stray placeholder + dead routes **Medium**

/blog/generic-hero returns HTTP 200 with 16 bytes (placeholder template page) and /guide returns 404. /pricing redirects to the noindex dashboard shell.

Recommendation: noindex or delete /blog/generic-hero; fix or remove /guide; build a real indexable /pricing page.

CSP blocks first-party analytics **High**

Console error: loading @vercel/analytics from cdn.jsdelivr.net violates the CSP script-src. AdSense (pagead2.googlesyndication.com) is likewise not whitelisted.

Recommendation: Whitelist cdn.jsdelivr.net, pagead2.googlesyndication.com (script), googleads.g.doubleclick.net + tpc.googlesyndication.com (frame) in the CSP.

2.2 Content Quality

Score: 48/100

What Works

- Blog posts are substantive (2,000-10,500 words with structured H2 sections, FAQ blocks, and internal tool links)
- Multilingual glossary (EN/ES/PT) with real definitions and Article schema
- llms.txt + llms-full.txt provide a comprehensive AI-facing content map
- Interlinking between blog and tools exists (blog-enhancements.js injects glossary links)

Findings

E-E-A-T vacuum on a YMYL-adjacent niche **High**

/about is noindex with no named founder/author; authorship is brand-only; contact is a Gmail address; legal entity absent from privacy/ToS; homepage 'Trusted by' section shows no verifiable logos.

Recommendation: Publish an indexable About page with a named founder, consistent author bylines on posts, business email/address, and remove unverifiable 'Trusted by' claims.

Scaled AI-template content risk **High**

Many blog posts follow the template 'Learn how to {keyword} 2026...' with near-identical phrasing; 58 blog posts + 10,986 programmatic glossary pages is high-volume automated output.

Recommendation: Add a human review/fact-check gate to the publishing workflow; differentiate post intros/outros; cite sources for data claims.

Thin pages in 3 templates **Medium**

Tools pages: 109-172 words, H2=0 (12 sampled); blog category hubs: 74-82 words; glossary vs-pages: 300-490 words of boilerplate ('How to Optimize' blocks).

Recommendation: Expand tool pages with how-to steps, examples, and FAQ; flesh out category hubs; vary glossary copy per term.

Multiple H1s on one post **Medium**

/blog/maximizing-youtube-revenue-with-sponsorships-2026 contains 6 H1 tags (198KB, 10,545 words).

Recommendation: Demote to H2/H3 in the template/regenerator and re-render the post.

Broken llms.txt entry + stale counts **Low**

llms.txt lists a '[null]' entry pointing to /blog/generic-hero and states 'Blog Posts (18)' and '95 tools' while the live sitemap shows 58 blog posts and 37 tool URLs.

Recommendation: Regenerate llms.txt from live content with accurate counts; drop the generic-hero entry.

2.3 On-Page SEO

Score: 62/100

What Works

- Single H1 on nearly all pages; meta descriptions present on 49/50 sampled URLs
- Canonical tags on core and content pages; keyword-rich titles
- 50 internal links on homepage; blog hub links to 47 posts
- Googlebot receives identical HTML to browsers (static prerender — no SPA wall)

Findings

Title tags too long on blog and tools **Medium**

Sampled blog titles run 62-96 chars (8 of 14 >60), tools titles 63-94 chars. Google truncates at ~60 (desktop) / ~50-55 (mobile).

Recommendation: Trim titles to <=60 chars in the generators; front-load the keyword.

Alt attribute corrupted by glossary-link injection **High**

On some blog posts the hero image alt contains raw HTML (...) — the glossary cross-linker is injecting links inside alt attributes, producing broken markup.

Recommendation: Make the glossary-link injection ignore attributes (only inject into visible text nodes); re-render affected posts.

Blog/tools slug cannibalization **High**

24 identical slugs exist under both /blog/ and /tools/ (e.g. youtube-intro-hook-first-3-seconds, youtube-tags-2026), both indexable with different templates.

Recommendation: Designate one canonical home per keyword (recommend /blog/ for articles, /tools/ only for interactive tools) and 301/canonical the losers.

Weak meta descriptions on some pages **Low**

A few meta descriptions are short (61-99 chars) or missing entirely (tools/description-writer has none).

Recommendation: Enforce 120-160 char descriptions across templates.

2.4 Schema / Structured Data

Score: **55/100**

What Works

- Homepage JSON-LD valid and rich: Organization (+logo.png), WebSite, SoftwareApplication, FAQPage, BreadcrumbList
- Tool pages emit WebApplication; /vs/ pages emit FAQPage; glossary emits Article — all parseable
- Blog posts with valid blocks include Article + FAQPage + SpeakableSpecification

Findings

Blog JSON-LD broken on ~50% of sampled posts **Critical**

7 of 14 sampled posts have unparseable ld+json blocks (e.g. youtube-intro-hook 4/5, youtube-metadata-auditor-vs-vidiq-shadow-ban 1/3, youtube-analytics-4-metrics 1/2) — unescaped HTML in JSON strings breaks Article+FAQPage.

Recommendation: Use a real JSON serializer in the blog template (json.dumps/htmlspecialchars), re-render affected posts, and add a schema validation step to CI.

SearchAction points to login-gated /dashboard **Medium**

WebSite SearchAction target is `https://yt-seo-architect.vercel.app/dashboard?q={search_term_string}` which is noindex and requires login for search results.

Recommendation: Point SearchAction at an indexable search surface or remove it.

Hub pages lack list schema **Low**

No ItemList/BreadcrumbList on /blog, /tools, /glossary hubs; no DefinedTerm on glossary entries.

Recommendation: Add ItemList to hub templates and DefinedTerm to glossary terms.

2.5 Performance (CWV)

Score: **65/100**

What Works

- Homepage HTML is lean (71KB); zero tags on homepage keeps layout stable
- Vercel CDN edge caching; immutable hashed asset names; static prerender (no client-side render wall for Googlebot)
- Only 3 external scripts on homepage; preconnects/dns-prefetches declared

Findings

No field CWV data available **Medium**

CrUX/GSC credentials are not configured (`google_auth --check: tier -1`), so LCP/INP/CLS cannot be scored from field data in this audit.

Recommendation: Connect a Google API key (`GOOGLE_API_KEY`) so future audits pull CrUX field data; meanwhile run Lighthouse on a real machine.

Third-party render dependencies + CSP-blocked scripts **Medium**

lucide icons load from unpkg.com (third-party render dependency); @vercel/analytics is CSP-blocked; AdSense loader is CSP-blocked.

Recommendation: Bundle lucide locally (or inline needed icons); whitelist analytics/ads domains in CSP or remove them.

2.6 AI Search Readiness

Score: **78/100**

What Works

- robots.txt explicitly allows ChatGPT-User, Google-Extended, PerplexityBot, ClaudeBot, OAI-SearchBot, Applebot-Extended, Bytespider
- llms.txt (200) and llms-full.txt (33KB) published with product summary, pricing, and topic index
- FAQPage schema on posts feeds direct AI answers; broad topical coverage across 10,000+ glossary terms
- Descriptive title/description pairs on most pages make them citable

Findings

llms.txt data-quality bugs **Low**

[null] entry for /blog/generic-hero; stale counts (18 blog / 95 tools vs live 58 / 37).

Recommendation: Regenerate llms.txt from the live sitemap with corrected counts.

Citation-blocking content errors **Low**

Broken JSON-LD and 404 glossary URLs dilute passage-level citability for AI crawlers that validate sources.

Recommendation: Fixing the JSON-LD and 404 issues above also improves AI citation reliability.

2.7 Images

Score: **50/100**

What Works

- Most pages carry zero or one image (fast, low bloat)
- Alt text present on sampled images
- Self-hosted PNG heroes deployed for most posts (picsum hotlink mostly removed)

Findings

Alt-attribute HTML corruption on blog heroes **High**

Glossary-link injection writes raw <a> HTML inside alt attributes on some posts (e.g. youtube-shorts-seo-guide-2026).

Recommendation: Fix the injector to skip attribute contexts; regenerate affected posts.

External image hotlink remains **Medium**

youtube-description-templates-2026 still loads its hero from picsum.photos (unreliable, no ownership).

Recommendation: Replace with a self-hosted branded hero like the other posts.

No next-gen formats or explicit dimensions everywhere **Low**

Heroes are PNG (not WebP/AVIF); some lack width/height (CLS risk on load).

Recommendation: Convert heroes to WebP with width/height attributes; add srcset.

3. Action Plan

Phase 1: Critical Fixes Week 1

- Purge ~3,000 404 glossary URLs from sitemap (generate from live-verified URLs only); add CI broken-link check
- Fix blog JSON-LD escaping in template + re-render affected posts (7/14 sampled broken)
- Fix glossary-link injection into alt attributes; re-render affected posts
- Add pagead2.googlesyndication.com + cdn.jsdelivr.net to CSP so AdSense and analytics load
- Exclude 5 noindex core URLs from sitemap

Phase 2: High-Impact Improvements Weeks 2-3

- Resolve 24 blog/tools cannibalization pairs (301 losers, one home per keyword)
- Make /about indexable with named founder + author bylines (E-E-A-T)
- Add security headers (XFO, nosniff, Referrer-Policy) + security.txt
- Trim blog/tools titles to <=60 chars in generators
- Add lastmod to glossary URLs in sitemap generator
- Fix llms.txt [null] entry + refresh counts

Phase 3: Content & Authority Month 2

- Expand thin tool pages (109-172 words -> 500+ with how-to/FAQ)
- Human review/fact-check gate on the blog publishing workflow
- Flesh out blog category hubs; vary glossary boilerplate
- Build a real indexable /pricing page; fix /guide 404 + /blog/generic-hero placeholder
- Bundle lucide locally; convert blog heroes to WebP

Phase 4: Monitoring & Iteration Ongoing

- Connect GOOGLE_API_KEY (CrUX field data) + GSC for indexation monitoring
- Backlink program (domain absent from Common Crawl) — directories, GitHub, HARO
- Re-run this audit monthly; add schema-validation and broken-link CI gates

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)

Report generated by Claude SEO — Google SEO Intelligence Skill — August 03, 2026
Methodology based on Google Web Vitals thresholds, Search Console documentation, and Lighthouse scoring algorithms.
